

Docker Swarm is the network of multiple docker engines connected to each other.

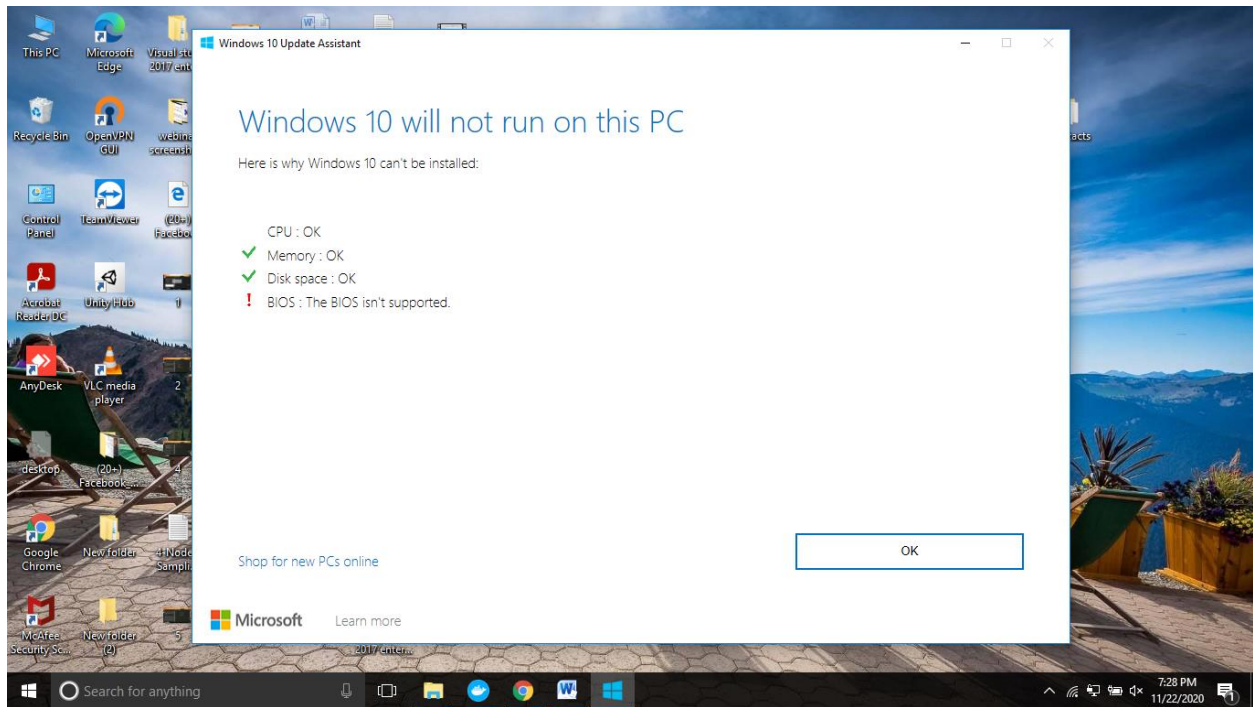

Docker manager is responsible to initiate the whole docker swarm. Docker manager has to make sure all the service and applications running effectively over docker engines.

Docker Compose is used to run multiple containers at once irrespective to the applications and service running over each of the container. Means you can run multiple dockers container with a single command by keeping all in one YAML file.

My laptop Inspiron N5110 is not supporting windows 10 update to meet the required version for Docker installation.
